O-rings are becoming an essential sealing element in a wide range of applications - a field which covers automobiles, pumps, and the general industry. O-rings are basically a device for closing (sealing) a gap or tightening a joint fluid. In this case the fluid can be gaseous or liquid.Maxspare offers O-rings for hydraulic, pneumatic, and rotary applications, and is generally only suitable for static and slow reciprocating (up to 20 cm / s speed) applications.For rotary applications, O-rings can be used where peripheral speeds are very low, but these are considered special cases that require careful design parameters and are not included in this standard. The dimensional tolerances for the metric series of O-Rings shown in Fig. 1, are listed in Table 1. O-Ring cross-sections of 1.00 mm to 40.00 mm and diameters up to 5000 mm and above are available.

APPLICATION

O-Rings can generally be classified in to dynamic applications (packing) and static applications (gaskets)

- Static Seal - Where the sealing takes place between surfaces which do not move relative to one another
- Dynamic Seal - Where sealing takes place between surfaces that have relative movement e.g., Reciprocating movement of a rod or a piston in a cylinder.

O-Ring used for static sealing is zero leakage seals which aim at providing a complete physical barrier in a potential leakage path to which they are applied. The O-Ring material chosen must be resilient enough to flow into any irregularities in the surface being sealed at the same time rigid enough to withstand the pressure & resist extrusion in the GAP. Any stress relaxation of the seal material may cause seal failure (which may cause creep into the clearance). All such O-Rings require an interference fit with one of the mating parts on the assembly.

The dynamic O-Ring performs sealing by imparting a preload pressure or squeeze providing sealing, due to the interference fit in a static condition. Under fluid pressure acting on one side of the seal through the clearance gap, the O-Ring section is deformed increasing the interface pressure by an equal amount to the fluid pressure. Thus, if the preload pressure is P & the fluid pressure, the effective interface pressure under working conditions is p + P (Fig. 2) because this is greater than the actual fluid pressure (P) sealing is maintained.

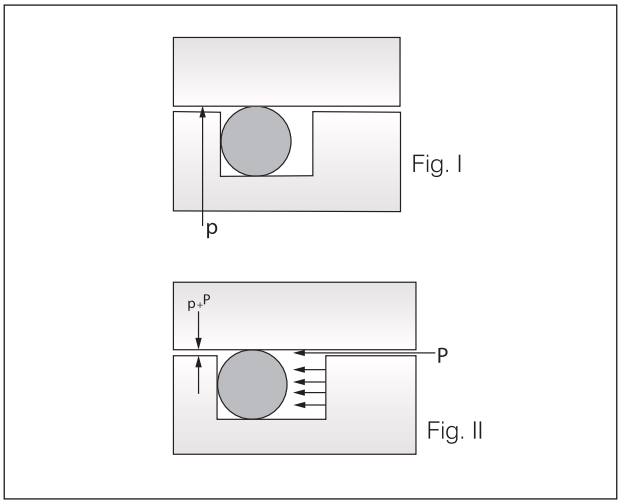

Fig. 2 :

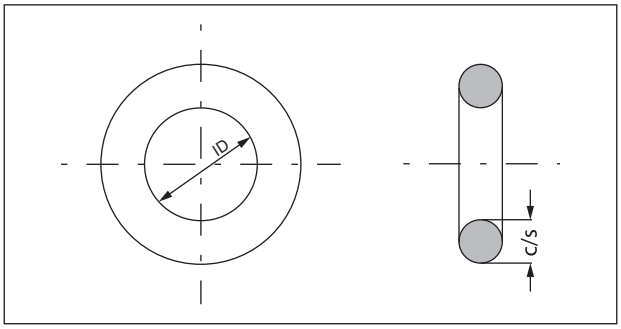

Fig. 1 : O Ring dimension

METHOD OF OPERATION

O-Rings are double-acting sealing elements. In the initial squeeze, which works in a radial or axial direction based on the installation, and O-Ring must be deformed on the diameter section to give it an initial sealing force within a housing (Fig. 3). When the system pressure is applied, the O-Ring deforms further (Fig. 4). But because of the initial squeeze, the sealing force always exceeds the force exerted on the O-Ring by the system pressure.

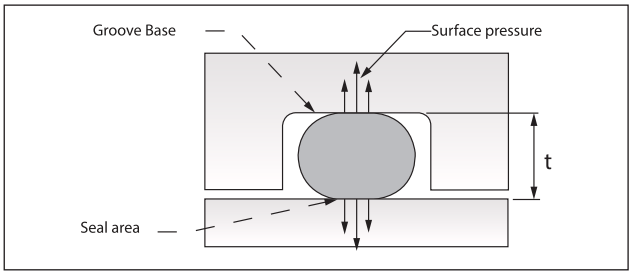

Fig. 3 : Compressed O-ring in installation space without pressure.

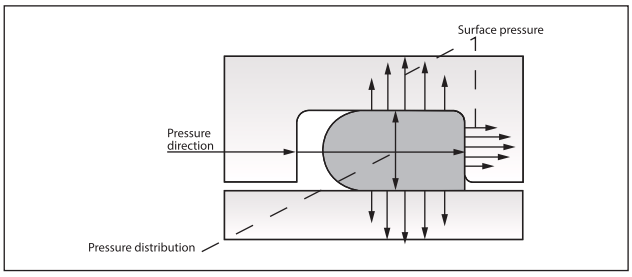

Fig. 4 : Compressed O-ring in installation space under pressure.

DESIGN RECOMMENDATIONS

General recommendations before starting installation are:

- Lead-in chamfers made according to standard.
- Bores deburred and edge rounded.
- Machining residues, e.g. chips, dirt and foreign particles are removed.
- Screw thread tips covered.
- Seals and components greased or oiled.

SEAL HOUSING DIMENSIONS, TOLERANCES AND DESIGN CRITERIA FOR STANDARD APPLICATIONS

Design criteria are based on the elastomeric compound of 70 Shore A, working at pressure up to 10 Bar and temperature between -30°C and +100°C. For other working conditions (pressures, temperature, etc) it may be necessary to select elastomeric compounds of other hardness or to incorporate anti-extrusion rings.

DETAILS

It is most important to choose the correct O-Ring dimensions to have an improved performance of the seals.

O-Rings sealing on outer diameter (Fig. 5) are expected to expand while seated on the Piston/Rod Groove to enable a tight fit generally 3 to 5% less than the actual groove dia.

Similarly, the O-Ring sealing on the inner dia is expected to have an interference fit with the nominal housing generally 2% to 4% higher on the outer dia. The O-Ring must always be seated in the end of the pressure side in the groove.

Similarly for face sealing O-Rings (Fig. 7), the outer diameter is required to have an interference fit with the outer dia. D1 in Fig. 6, or the same dia. as D1 when pressurised internally.

LEAD-IN-CHAMFER

O-Rings are squeezed during installation, lead-in chamfers and rounded edges must be provided, this will help to eliminate possible sources of damage and seal failure. (Fig. 8 & 9)

EXTRUSION GAP

The process by which the seal material is forced into the clearances between components is called gap extrusion and the size of this clearance gap is called the extrusion gap. If the gap is too large, there is a risk of seal extrusion which can result in the destruction of the O-Ring (Fig. 10).Extrusion of O-Rings may also be prevented by using anti-extrusion (back-up) ring. These are thin rings of harder material fitted into the gland between the seal and the extrusion gaps, which essentially provide zero. Below table shows the permissible extrusion:

Table: 3 PERMISSIBLE EXTRUSION GAP

Table: 3 Permissible extrusion gap given in the table is valid for temperatures up to 70°C. For silicone materials, the values for the gap sizes are to be halved.

TRAPEZOIDAL O-RING GROOVE

The trapezoidal (dovetail) groove should only be used in special cases, e.g. overhead installation, to keep the O-Ring (Fig. 11). It is often necessary to provide some mechanical means for holding an O-ring in a face seal groove during assembly and maintenance of equipment. Although this method has been used successfully, it is not generally recommended. The installation dimensions are summarised in Table 4. Groove processing here is costly and time-consuming, therefore recommend its use only with a cross-section from 3.53 mm.

TRIANGULAR O-RING GROOVE

This type of crush seal is used where cost and ease of machining are important. In this type of installation space, the O-Ring has contact on three sides. However, the defined O-ring contact pressure is not guaranteed. a O-Ring is confined in a triangular recess made by machining a 45-degree angle on the male cover and offers little space for any swelling of the O-Ring. Pressures are limited only by clearances and the strength of the mating parts. The O-Rings are permanently deformed.

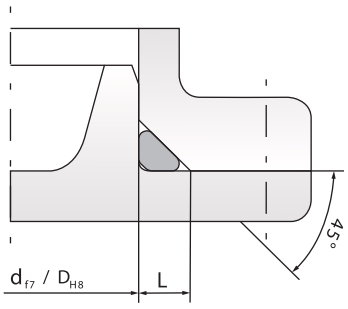

Fig. 12 : Illustration of a triangular groove.

If this groove shape is unavoidable then the dimensions and tolerances in the following table should be adhered to. The O-Ring cross-section (c/s) should exceed 3 mm if at all possible.

ACRYLONITRILE-BUTADIENE

Commonly known as NITRILE or BUNA-N. The acrylonitrile content of nitrile rubber varies from 18 to 50%, the polymers with high acrylonitrile content have better oil resistance whereas low acrylonitrile content exhibit better compression set and low-temperature flexibility. Nitrile has moderate physical properties but good abrasion resistance. Gas permeability is low and Ozone resistance and electrical properties are poor.

HYDROGENATED NITRILE-BUTADIENE (HNBR / HSN)

The properties of HNBR depend upon the acrylonitrile content and the degree of hydrogenation of the butadiene copolymer. They have rather better oil and chemical resistance than Nitrile Rubber and can withstand much higher temperatures. It has excellent resistance to sour oil and gas, steam, hot water, and ozone. Physical properties (e.g. tensile and tear strength, elongation, abrasion resistance, compression set, etc.) are also excellent and compounds exhibit good dynamic behavior at elevated temperatures. Limitations include poor electrical properties, poor flame resistance, and attack by aromatic oils and polar organic solvents.

Agressive Fluids

CIP (Cleaning in Place) and SIP (Sterlization in Place) are the general method for cleaning processing systems. This process ensures safety and toxic contamination of products and minimize recontamination of the process.

Sealing material should be compatible with the chemicals used in CIP & SIP process. Maxspare thus take care of this while selecting an appropriate sealing material.

CAUSES OF O-RING FAILURES & COUNTER MEASURES

MAX SPARE LIMITED
QUALITY. PRECISION. SPEED.

- When leakage is observed, investigate the causes and implement proper countermeasures.
- To identify the causes, it is critical to observe the O-Ring closely and evaluate the failure in all respects, such as cylinder, piston and medium to be sealed.

D = Dynamic Sealing
S = Static Sealing

FAILURE	CONDITION		APPEARANCE SKETCH	MAJOR CAUSES	COUNTERMEASURES
Twist	Twisted & Deformed.	D		• Excessive speed. • Eccentric movements • Poor surface finish on sliding face. • Twisted installation.	• Improve sliding surface finish. • Install with adequate lubricant.
Chipping	Partially chipped.	D		• Chipped by the bore edge, threads or sharp corner at installation.	• Round all sharp edges. • Use an installation O-Ring hook.
Permanent Set	Deformed into the groove's shape.	D & S		• Exposure to repeated drastic temperature changes. • Improper adjustment of temperature, compression & fluid.	• Study alternative rubber materials. • Study groove dimensions.
Abrasion around the circum-ference	Worn all round the circumference.	D		• Poor sliding surface finish. • Poor lubrication. • Entry of dust or other foreign materials.	• Improve sliding surface finish. • Supply sufficient lubrication. • Clean thoroughly & use filter etc.
Partial Abrasion	Sliding surface is partially worn.	D & S		• There are damages on sliding surface.	• Remove damages on sliding surface & improve surface finish.
Hardening	Hardened and cracked when bent.	S		• Operating temperature is higher than the rubber's heat resistance limit.	• Study alternative rubber materials.
Swelling	Softened and swollen.	S		• Improper rubber material. • Cleaned with fuel oil or other incompatible fluid.	• Study alternative rubber materials. • Clean with kerosene.
Scratch	Scratch marks are observed.	S		• Scratched by a thread or sharp edge at installation.	• Use an installation O-Ring hook.
Protrusion	The outside or inside of the ring is cut off partially or around the entire circumference.	S		• Inappropriate determination of pressure, gap & hardness. • Due to swelling.	• Restudy pressure, gap & hardness. • Apply backup rings. • Study alternative rubber materials.
Tearing	The squeezed portion is cut off or chipped.	S		• Poor chamfer. • Groove depth is not sufficient.	• Improve chamfer. • Restudy groove depth.
Cracked by ozone	Cracks are observed on all over the ring.	S		• Left in the air in a stretched condition.	• Do not stretch the ring. • Coat grease or oil to the O-Ring to avoid contact with air. • Study alternative rubber materials.

Dotted line shows original O-Ring shape or size.

INSTALLATION & MAINTENANCE OF SEAL

The installation process performed correctly can increase the service life of the component as well as the application. Incorrect installation can lead to assembly damage, causing leakage. The following are the recommendations for proper o-ring installation to help prevent these problems:

INSTALLATION INSTRUCTIONS

- Check whether the housing or rod has a lead-in-chamfer. If not use an installation sleeve.
- Debur and chamfer or round sharp edges. Cover the lips of any screw threads.
- Remove machining residues such as chips, dirt, and other foreign particles and carefully clean all parts.
- Lubrication - The seals can be installed more easily if they are greased or oiled. Proper lubrication will reduce the installation force and create a smooth transition.
- Choosing proper lubricant - Attention must be paid to the compatibility of the seal materials with these lubricants. When choosing a lubricant, the following points must be taken care:
  - Compatible with the material being used
  - Suitable for the temperature range of the application
  - Capable of producing a high surface tension film
  - Compatible with system fluids
- Do not use installation tools with sharp edges. Also, avoid forcing the O-Ring over sharp corners.
- When stretching the O-Ring around the shaft, stretch it evenly. Do not pull from one side. Also, try to stretch the O Ring as little as possible. This will provide a tighter seal and added security.
- When installing an O-Ring, do not roll it down the shaft. Instead, slide it down.

TIPS TO ENHANCE THE LIFE OF SEALS

- Do not store seals on the shop floor.
- The seals should be stored properly in a cool area and at Relative Humidity of 40%-70%.
- Packing must be airtight and intact. Seal lip should not be distorted by handling or hanging on a peg or nail.
- Correct installation tools must be used.
- The sealing area should be clean and dust-free of grit or contamination.
- The correct seal profile should be used as per the application.
- Ensure the operating temperature does not exceed the limit of the sealing material.
- Lubricant, including additives, must be compatible with the material of the seal (Check compatibility chart I on page no. ____ or website www.maxspare.com).
- The leading edge of the shaft should be chamfered.
- Tolerance for the shaft diameter must be within the range of the seal being used.
- Whenever possible, equipment should be vented to the atmosphere to prevent pressure build-up.
- Worn-out seals must not be used/reused.

Removing 'O' Rings from the seal with steel implements poses the real danger of damaging the 'O' Ring seat. With Max Spare 'O' Ring Hooks the removal of 'O' rings is simple, and safe. The 'O' Ring hooks come in a set of 4, with different profiles. The design of the hooks is such that it does not damage the seat. Knurled handle provides firm grip.

Storage Conditions:

Most polymers, including vulcanized rubber and other elastomers, tend to change their properties during storage and may become unusable. This may be due to hardening, softening, cracking or other deterioration and may result from exposure to oxygen, ozone, light, heat and / or moisture.

The following recommendations indicate the most suitable storage conditions for elastomeric products, whether it is a single item or a composite product.

1. **Temperature** - Ideal storage temperature should be 25°C (77°F). Low temperatures are not permanently harmful provided the rubber items are handled carefully and not distorted. When taken from low temperatures items should be raised to approximately 30°C (86°F) before they are used.
2. **Humidity** – Relative humidity is of 40% to 70% in a draft-free atmosphere.
3. **Light** – The products should be protected from direct sunlight, ultraviolet and artificial light have a high UV content.
4. **Oxygen and Ozone** - Wrapping, storage in airtight containers or other suitable means should be used for vulcanised rubber items. Storage in containers that limit exposure to environmental conditions (e.g. sealed plastic bags) should be used for all materials.
5. **Radiation** – Products should be protected from all sources of ionizing radiation.
6. **Deformation** – The rubber items should be stored in a relaxed position, without tension or compression. Laying the product on a flat surface and preventing its suspension or crushing keeps it from deforming and minimizes deformation.
7. **Contact with liquid or semi-liquid materials** – Rubber should not come in to contact with liquid or semi-liquid materials or their vapours at any time during storage, unless these materials are an integral part of the product or the manufacture's packaging.
8. **Contact with Metals** - Metals such as manganese, iron and copper, or copper alloys can have a harmful effect on rubber. A layer of paper, polyethylene or cellophane will keep these separated.
9. **Contact with Non-Metals** - Contact with other rubbers should be avoided.
10. **Stock Rotation** - Elastomers should be stored for as short a period as possible, and practice the First In First Out (FIFO system) stock liquidation.
11. **Cleaning** - Organic solvents such as trichloroethylene, carbon tetrachloride and petroleum are the most harmful agents. Soap and water and methylated spirits are the least harmful, and all parts should be dried at room temperature before use.
12. **Shelf Life** - The table shows the storage life of seal components made from the more common materials under ideal conditions. Storing under less than ideal conditions will reduce the life of the component.

Careful inspection for the following should be made before installation after storage:

- Cracks or Surface crazing
- Permanent distortion
- Mechanical damage
- Surface softening or hardening

O-RING CORD

DETAILS

O-Ring cord is excellent for large diameter static and low-pressure dynamic applications, but they are not recommended for rotary movements. Because they take up less space and provide two-sided sealing compared to other sealing elements, O-ring cords make designing easier. Obtaining good results from Cord O-ring applications depends on suitable measurements, choosing correct materials, and suitable surface quality on metal parts.

MATERIAL

NBR 65 to 90 Shore A
FKM 65 to 90 Shore A
Silicon 65 to 90 Shore A
PU 85 & 90 Shore A

COMPATIBILITY

Mineral oils, bio-oils, water-soluble & water-glycol fluids

OPERATING CONDITIONS

Temp. range : -30°C to +220°C
Pressure : 40 Bar (Depending on the joint)

APPLICATION

- Used in almost every industry but especially in non moving machinery and static sealing applications, e.g. as a flange or cover seals.
- For special dimensions, the O-ring cord has a clear advantage as the application can be customized to the solution in question while being a relatively low-cost solution.
- Good chemical resistance to mineral oils and greases and hydraulic oils. Not suitable for outside use because of poor resistance to ozone and UV rays.
- Medium precision seal requirement.
- Large diameter axial sealing.

TOLERANCES

The general tolerances permissible on O-ring cords are the following:

O-Ring Cord Diameter	Tolerance
1 – 5 mm	± 0.30 mm
5 – 10 mm	± 0.40 mm
10 – 15 mm	± 0.50 mm
15 – 20 mm	± 0.70 mm
20 <	± 0.50%

FEATURES

- Can be used both for the hydraulic and pneumatic applications
- Can be used both for static and low-pressure dynamic applications.
- Used both rod and piston applications.
- Wide compound range.
- Wide range of dimensions.
- Easy installation and removal.
- Economical sealing solutions.

INSTALLATION

O-rings are fitted into the groove by hand. It is very important that the assembly tools must be of soft material and have no sharp edges. Before installation, all individual parts of the seal must be lubricated.

O-RING CORD KITS

We also supply O-ring cords in boxed sets. These boxes contain different sizes of cords each in 2-meter length.

ORC-KIT-101 for imperial sizes

ORC-KIT-102 for metric sizes

GENERAL TECHNICAL INFORMATION
QUAD-RING

DETAILS
The quad-ring sealing principle is almost similar to O-Ring sealing. The initial sealing is obtained by the diametrical squeeze in right angle grooves and the pressure of the system only creates a positive seal force.

APPLICATION
Quad rings can be used for a wide range of applications e.g. reciprocating dynamic or rotary applications. Quad rings are suitable for all applications where operation under low pressure and low-temperature conditions.

Quad rings are used in a wide range of dynamic and static applications, including:

- Reciprocating rods and plungers.
- Rotating and spiral movements on shafts and spindles.
- Radial-static seal for bushings, pipes, etc.
- Axial-static seal for flanges, etc.

ADVANTAGES
- Due to its special profile, the seal does not tend to roll in the groove during reciprocating movements.
- With Quad-Rings the standard grooves are deeper in comparison with O-ring glands. So the diametrical squeeze is lower than with O-rings. This makes dynamic sealing possible with reduced friction.
- The four lips of the Quad-Ring create more sealing capacity and at the same time a groove for lubrication, which is very favourable for dynamic sealing.
- Quad-Ring has high stability for dynamic applications.
- The four-lobed design creates a more stable seal avoiding spiral twisting.
- Unlike an O-Ring, the mould line flash lies in the trough, between and away from the critical sealing lips.

Quad-Ring seals are supplied under the American Standard AS 568.

METHOD OF OPERATION
Quad-Ring seals are a self-energizing double acting sealing element. The initial sealing is achieved by the diametrical squeeze in a right-angled groove. The system pressure itself creates a positive sealing force.

LEAD-IN-CHAMFER

Quad-Rings are always fitted oversize therefore lead-in chamfers and rounded edges must be provided (Fig. 18 & 19) The length of lead-in chamfer (z) as shown in Table 9.

The permissible surface roughness of the Lead-in Chamfer is defined as $Rz < 6.3\,\mu m$ $Ra < 0.8\,\mu m$

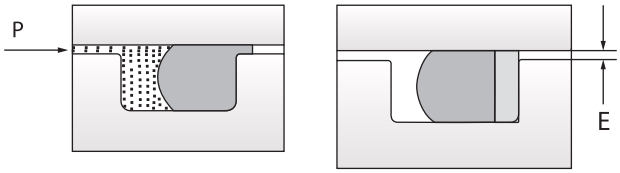
If the pressure exceeds the recommended level or if the gap is larger than recommended, the O-ring should be supplied with a back-up ring to prevent the extrusion into the gap and consequential damage to the O-Ring. A back-up ring is a ring of hard, extrusion resistant material such as high durometer nitrile, nylon, Hytrel, Polyurethane, or PTFE. These are primarily used in conjunction with O-Rings in high-pressure applications for support or as spacers. They are flat, concave section elements with a cross-section, and on request, spiral rings can be supplied for very specific working conditions, such as sudden temperature fluctuations. Even if the ring shrinks, there is always a spiral protecting the O-ring from extrusion.

Fig__: Back-up ring



When selecting a back-up ring, the following three points must be taken care:

- The inner dimension of the ring, or the outer dimension of the shaft on which the back-up rings will be applied.
- Radial cross-section of the seal.
- Ring thickness, or the axial width of the cross-section of the ring.
